International Chemicals Engineering

International Chemicals Engineering (ICE) specialise in chemical injecting system solutions, metering pumps and odour control products.

ICE is committed to embedding sustainability into their business model and operations. They aim to continuously improve their business to make a more pleasant work environment and decrease their ecological footprint.

Their sustainability journey started a number of years ago when they planted native trees around their facility to shade office windows during summer and also create a pleasant working environment and break out space for staff. This led to a number of additional initiatives more recently including:

- Installing a solar panel system to reduce operational costs and greenhouse gas emissions associated with powered equipment.
- Using natural ventilation to improve efficiency of their heating and cooling systems.
- Implementing an insulated temperature controlled space in their stock operations area.
- Installing a rainwater tank, with water used for their landscaping, general wash down and spillage operations.

Finally, sustainable products are produced at ICE for specifically engineered systems. This includes solar powered dosing systems for remote chemical dosing installations that assist in odour control.
